Tire And Service Guide

Tire pressure should be checked at least once a month and before long trips. Maintain the recommended pressure as listed in the vehicle’s touchscreen under Controls > Service > Tires. For most models, this is 35 psi for the front tires and 37 psi for the rear. Adjust pressure when tires are cold—after the vehicle has been parked for at least three hours or driven less than a mile. Underinflated tires reduce range by up to 5% and increase wear. Overinflated tires reduce grip and ride comfort. Use a reliable gauge; avoid relying solely on the low-pressure warning in the app.

Tire rotation interval

Rotate tires every 7,500 miles or every 6 months, whichever comes first. This helps ensure even wear and maximizes tire life. Rotations are especially important on all-wheel-drive models where front and rear tires experience different loads. The vehicle will prompt you via the touchscreen when a rotation is due. If you notice uneven wear, vibrations, or pulling to one side, schedule a rotation immediately.

Scheduling service in the app

Open the Tesla app and tap the vehicle icon. Select “Service” from the menu. Choose “Schedule Service” and pick a preferred date and time. Available slots are updated in real time. You can select from mobile service, a nearby service center, or a mobile service appointment at your home or office. The app will confirm your appointment and send a reminder 24 hours in advance. If you need to reschedule, do so at least 2 hours before your appointment.

Mobile service

Mobile service is available in most regions and covers 95% of routine maintenance. A certified technician will come to your home, office, or parking location during your scheduled appointment. This includes tire rotations, wiper blade replacement, cabin air filter changes, and minor inspections. Mobile service takes approximately 45 minutes. The technician will bring all necessary tools and parts. No need to leave your vehicle unattended—your car remains secure during the visit.

Service center visits

Visit a service center for complex repairs, diagnostics, or if mobile service is not available. Locate the nearest center using the app or the vehicle’s touchscreen. Arrive 10 minutes before your appointment. The service center team will perform a full inspection, including brake checks, battery health, and software updates. Most standard services take under 90 minutes. While you wait, use the lounge area with free Wi-Fi, charging ports, and refreshments. Your vehicle is monitored via the app during service.

Wiper blade replacement

Replace windshield wiper blades every 12 months or sooner if streaking, chattering, or reduced visibility occurs. The vehicle will notify you via the touchscreen when wipers are due. Use only Tesla-approved wiper blades. To replace them, open the hood, lift the wiper arm, and disconnect the old blade by pressing the release tab. Attach the new blade by aligning the connector and snapping it into place. Reinstall the arm gently. After replacement, test both wipers to ensure proper operation.

Cabin air filter replacement

Replace the cabin air filter every 15,000 miles or every 2 years, whichever comes first. The vehicle will prompt you when replacement is needed. The filter is located behind the glovebox. To access it, open the glovebox and remove the two screws securing the panel. Slide the panel out and pull the old filter straight out. Insert the new filter with the arrow pointing toward the cabin. Reinstall the panel and secure with the screws. After replacement, the air quality sensor will recalibrate within 30 seconds. This helps maintain optimal cabin air quality and reduces allergens.
